Futaba_Webs Mentorship Program details v1

Premise of the Program:

This is a hybrid program that functions as a: ***Bootcamp***, ***Mentorship,*** and ***Resume/Portfolio*** work program. You get the best of both worlds in many aspects and have access to a wide range of services that give you more bang for your buck! Traditionally a combination of stuff like this would cost you out of pocket 17k, with no guarantee for a job. My program isn't focused on job placement, but to get you the hands-on training that you need to succeed. If you like the sound of that, then this is the program for you!

CHECK OUT MY FREE SAMPLES <u>HERE,</u> AS WELL A PUT TOGETHER LIST OF THE BEST CYBER SECURITY RESOURCES I'VE MADE IN CASE YOU WISH TO GO THE FREE ROUTE. If you happen to like my loads of free samples and exploit guides, as well as FREE demonstration videos, then you'll LOVE my program.

IF YOU CHOOSE THE FREE ROUTE ENTIRELY, YOU WILL NOT RECEIVE DIRECT MENTORSHIP OR GUIDANCE FROM ME SO DO NOT ASK!!!

You only get access to the material for as long as you are enrolled in the program, so be wise when making your choice. It's the same concept when you pay for any form of subscription based service.

Since I'm always learning, the program will forever be evolving, and thus receive constant updates with new techniques and exploits that will be EXCLUSIVELY for you the entire time, ***WITH NO ADDITIONAL COST TO ANY OF THE TIERS. If there is a raise in price it's due to yearly assessments on financial needs to maintain the program like all things. Anything that gets added like a module won't directly be the cause of a price raise!!!***

You also gain access to EXCLUSIVE patreon and discord benefits as well as swag merch which I'm looking into getting for the program.

Table Of Contents

Program Details

Bootcamp Details *(pg 7)*
- ** Payment and Fees*

Mentorship Details *(pg 8)*
- ** Coaching Calls*
- ** Step by Step Guidance*

Resume and Portfolio Work Details *(pg 8)*

The core Curriculum

Cyber Security Core fundamentals and Certification prep *(pgs 9-15)*
- ** Chapter 1_ Security Policies and PenTest Phases*
- ** Chapter 2_ FootPrinting and Information Gathering*
- ** Chapter 3_ Port Scanning And Enumeration*
- ** Chapter 4_ Sniffing and Evasion of IDS*
- ** Chapter 6_ Web Based Hacking*
- ** Chapter 7_ Wireless Encryptions*
- ** Chapter 8_ Bluetooth and IoT hacking*
- ** Chapter 9_ Cloud Computing Security*
- ** Chapter 10_ Virus Types*
- ** Chapter 11_ Cryptograph*
- ** Chapter 12_ Social Engineering*

** Chapter 13_ Access Control Systems*
** Chapter 14_ Authentication Methods*
** Chapter 15_ DNS Security Methods*
** Chapter 16_ General Information*
** Chapter 17_ Networking Protocols*
** Chapter 18_ Networking Terminology*
** Chapter 19_ Port Numbers To Know*
** Chapter 20_ Risk Management*
** Chapter 21_ Software Development Model*
** Chapter 22_ Data Sanitation Model*
** Chapter 23_ DNS Record Types*
** Chapter 24_ IP Error Codes*
** Chapter 25_ Intro to NetCat*
** Chapter 26_ Intro to NMAP*
** Chapter 27_ Intro to SNORT*
** Chapter 28_ Intro To WireShark*

Software Engineering Python3 *(pg 17)*
* General core programming concepts
* OOP Programming
* Black Hat/Gray Hat Python
* GUI Programming

C/C++ (pg 18)

* General core programming concepts
* OOP Programming
* Win32 API Programming and Malware Exploitation
* Arduino/Electrical Engineering (***CHECK PAGE 28 FOR THIS***)

Linux Fundamentals (pgs 19-23)

* The File System
* Shell Features:
* Basic File Operations:
* Directory Operations:
* File Viewing
* File Creation and Editing
* File Properties
* File Locations
* File Text Manipulation
* File compression and Packaging
* Viewing Processes
* Controlling Processes
* Scheduling Jobs
* Logins, logouts, and shutdowns
* Users and their environment
* User Account Management
* Becoming Super User
* Host Information/Location

* Network Connections
* Audio and Visual
* Installing Software

HTML/CSS/Javascript (pgs 24-26)
* Vanilla HTML/CSS/JS
* BootStrap5
* Gray Hat Javascript

SQL (pg 26)
MySQL
Postgres
MariaDB
Microsoft MYSQL

PHP (pg 27)
* General core programming concepts
* OOP Programming
* RCE remote file inclusion techniques
* Backend server side programming

Pen-Testing *Network Penetration Testing:* (pgs 29-31)

* *Botnetting*
* *ARP Poisoning*
* *LAN Turtles*
* *MITB*
* *WIFI Hacking*
* *Evil Twin Attack*
* *Mobile Hacking*

General Labs (pgs 31-32)

* *Physical Hacks*
* *Bluebugging Attacks*
* *Cipher Text Analysis*
* *Burp Suite*
* *BufferOverflow*

CTF Training *HackTheBox* (pgs 32-33)

PicoCTF

CustomCTF Challenges & Futaba's Playground

Bootcamp Details:

The cost of the program is traditionally annually like most boot camp based programs where you pay your tuition up front.

You also have the option to pay monthly which is what I'm going for. It will be split into 3 tiers that you can choose from.

Tier 1 ($50) ($600 annually)

For this tier, you'll be strictly able to focus on the hands-on part to get yourself up to speed, as well as receive the guidance that I of course will provide to you, and anything else. This one is meant for those that don't need as much support and would like to operate on their own, asking questions if they need to. SUPER FRIENDLY TO THOSE THAT HAVE CERTS AND JUST WANT HANDS ON TRAINING! ***Certification material is not provided or will I provide guidance on that if you choose this tier!***

Tier 2 ($100) ($1200 annually)

For this tier, you'll be strictly able to focus on the hands-on part to get yourself up to speed, as well as receive the guidance that I of course will provide to you, and anything else. This one is meant for those that don't need as much support and would like to operate on their own, asking questions if they need to. SUPER FRIENDLY TO THOSE THAT HAVE CERTS AND JUST WANT HANDS ON TRAINING! ***Certification material is provided and you get full support with the material should you choose this tier!***

Tier 3 ($200) ($2400 annually)

This is meant for those that ***HAVE ZERO CYBER SECURITY KNOWLEDGE AND EXPERIENCE!*** I will personally go over all the material with you full in depth and assess how well you understand the material. On top of that you also get the hands on training and full guidance you need if you are fully new and looking to transition into Cyber Security.

Mentorship:

You'll also be given two forms of direct mentorship from me, ***Coaching calls, Step by step guidance,*** and ***Resume and portfolio work,*** as well as a ***Portfolio Site*** that I will give you based on the template that I have for my own, OR, if you choose to, from one that you want me to mod for you. My template on its own is going to sell for 500 due to more features being constantly added to it so hop on that as it's bundled with the program!

Coaching calls, where I check in with you on a weekly basis to see what you need help with, as well as booking appointments should you need help during any point of time during business hours, as well as the ability to freely ask me questions if you need help with anything related to the material in the program.

Step by step guidance, where you'll receive direct help and support for any and all material in the program, where I essentially walk you through the steps I took to learn what I know. A lot of people need step by step guidance. Even if the resources available to you are ***FREE,*** you still need to be told where to go, and which resources will be the most effective in order to step up your game!

Resume and portfolio work, where I basically sit you down and look over all of your credentials and polish them up with both a word version, as well as a custom version you can pick out from a free canva template, including any cover letters that you might also need help with. You also get help with setting up a portfolio as well as things like your Github, linkedin, portfolio site, etc. Any and all hands on training in my program go inside your portfolio

Portfolio Site work, where I help you get your website up and running via my template or one that you personally want to use. This helps you look the part and make your content more engaging. I help set it up as well as anything you would like added to the pre-existing template. Sadly, I do not add custom features for you, otherwise I would have to charge you that. Besides, I'm a hacker, NOT a web developer!

The core Curriculum:

These are the main aspects of the program that will be covered in full detail

There will be video demonstrations for any and all topics that require them, as well as guides that you can read through as well alongside them that break down the material in the video down to the simplest terms so that it's easy to follow and understand even for beginners.

Cyber Security Core fundamentals and Certification prep

This section of the program is going to be more focused around the core fundamental knowledge that will get you ready to take the following certifications in order: ***Security+, CEH, CySA+, ISC2 CC***, as well as a lot more that I have coming soon for stuff like the: ***Linux+, Network+, PenTest+,*** as well any and all certs that are useful for you if you wish to pursue the path of ***Offensive Security.***

The main goal for covering all the material here is to get you up to speed with the core knowledge that is needed to understand Cyber Security. The key thing you need to be mindful of, when learning any cert, is how it can be applied in the real world for Cyber Security. All of the certs I just mentioned, taught me the very basics of ethical hacking, in which I then applied, leading me to where I am today! YOU NEED TO KNOW THIS STUFF AS YOU WILL SEE IT!

These are the core chapters and material that will be provided to you, with a lot more coming soon!

ANY AND ALL MATERIAL COVERED HERE IS STUFF YOU WILL 100 PERCENT SEE ON THE TEST. Anything else has been filtered and plucked through, as well as advanced research for anything that has been spotted on the exam!

Chapter 1_ Security Policies and PenTest Phases

- This is going to help you understand the various core security policies that exist within the Cyber Security domain, as well as get the main gist of how the pentest phases work and how you are supposed to go about it to be a successful offensive security professional.

Chapter 2_ FootPrinting and Information Gathering

- Here, you'll learn about the various core footprinting tools and techniques that you need to gain basic information about your target.

Chapter 3_ Port Scanning And Enumeration

- Here, you'll learn about the various port scanning techniques and enumeration methodologies that are needed to gain more in depth information about your target, as well as the list of services that are on them. This allows you to map out any and all possible vulnerabilities that might exist for them, allowing you to exploit targets to gain access to the system and pull off stuff like RCE, remote code execution for example.

Chapter 4_ Sniffing and Evasion of IDS

- Here, you'll learn about various network traffic analysis sniffing techniques that can be used to gain more insight on a particular network that you are targeting for a pentest, as well as various techniques that can be used to evade IDS and IPS detection systems. You'll also learn how to bypass filters that might block ICMP data packets on a network if you need to perform host discovery.

Chapter 6_ Web Based Hacking

- Here, you'll learn about the core fundamentals of web application penetration testing. This section is going to feature a 2 hour video that is going to get you up to speed on all the basics that you need to know to jump right ito web application penetration testing. ***Take your time going over the video as it can be a bit overwhelming at first. It also covers a lot of core tools and techniques that can be used to aid you in web penetration testing for beginners!***

Chapter 7_ Wireless Encryptions

- Here, you'll learn about the how wireless access points work, the various methods that are used to secure them, as well as a ***LIVE video demonstration on how to hack into a WPA2 protected access point!***

Chapter 8_ Bluetooth and IoT hacking

- Here, you'll learn about the core fundamentals of bluebugging attack methods, how they are performed, as well as any general information about common OWASP IoT vulnerabilities for both web applications as well as mobile IoT end devices.

- You'll also get a live demonstration on how to apply bluebugging attacks via a tool known as "***bettercap"*** that is commonly one of the best tools to use in order to pull off a bluebugging exploit. You'll also learn various tools to gain more in depth information on bluetooth enabled devices

Chapter 9_ Cloud Computing Security

- Here, you'll learn about the concept of cloud computing infrastructures, how they work, and the various types, as well as infrastructure terminology that you'll often see in regards to it.

Chapter 10_ Virus Types

- Here, you'll learn about the various malware archetypes that exist, how they work, which is going to be heavily covered in the programming section of the program for malware development.

- You'll also learn a bit about a technique that is known as steganography, that is commonly used to obfuscate and mask other pieces of data within one another, as well as a ***live*** demonstration on how to apply it with encoders that will be provided to you.

Chapter 11_ Cryptography

- Here, you'll learn about the core concepts of cryptography and various hashing algorithms. I'll cover how they work, as well as a few demonstrations on how to use them as well, with a bit of cipher text analysis demonstrations to show you how to crack ciphers at play, which come in handy for a lot of CTF and assessment challenges you'll often see during job interviews.

Chapter 12_ Social Engineering

- Here, you'll learn about the concept of social engineering tactics and how they are applied to the real world to compromise system infrastructures.

- There will be access to a live video that is going to show you how it works in live action via a man in the browser exploit.

Chapter 13_ Access Control Systems

- Here, you'll learn about the various forms of access control systems that exist, and how they work in an overall security infrastructure.

Chapter 14_ Authentication Methods

- Here, you'll learn about the various authentication methods that exist, as well how each of them works in order to properly secure and authorize end users to a system.

Chapter 15_ DNS Security Methods

- Here, you'll learn about the core methods that are needed to secure DNS servers in full detail.

Chapter 16_ General Information

- This is a bit of a general section, but it will cover a lot of fundamental knowledge that will come of use to you whether it be for one of the many exams that the material caters to, or overall for Cyber Security. ***YOU WILL SEE THIS STUFF ON THE EXAMS SO DO NOT SKIP IT!***

Chapter 17_ Networking Protocols & Chapter 18_ Networking Terminology

- Here, you'll learn about the core basic networking fundamentals that are needed to understand how networking works under the hood, which is CRUCIAL in order to understand Cyber Security.

- You'll also learn about the OSI model and the overall relationship between hardware, software, and networking level.

- This is also going to include a lot more in depth information that is covered from the Network+, A+, and core IT fundamentals overall. The list goes on for this module

Chapter 19_ Port Numbers To Know

- Here, you'll learn about the most common and useful port numbers that you'll often see on the job. CHECK IN WITH THIS MODULE REGULARLY AS IT'S GOING TO GET UPDATED WITH MORE PORT INFORMATION ON A REGULAR BASIS!

- You'll often commonly see a lot of job interviews asking you about general port knowledge. YOU NEED TO KNOW THIS!

Chapter 20_ Risk Management

- Here, you'll learn about the core basics of how to assess risk, as well as the main core concepts of the incident response plan. A lot of the material here is going to stem from the CySA+ cert as it heavily revolves around this. It’s also a good module if you are someone that wishes to understand some of the core elements and aspects of blue teaming.

- ***I specialize in red teaming and offensive security, so sadly I won't have any videos to showcase me executing a main IR plan. The whole point of this module is to help you understand a lot of the core life cycles for handling risk, as well as stuff like vulnerability management, etc. Regardless of which side you are on: red team, blue team, etc, you do need to understand the material as it will often come up in a lot of critical Cyber Security discussions, and of course, WILL BE ON THE EXAM!***

Chapter 21_ Software Development Model

- Here, you'll learn about how the software development life cycle works. This is going to get you into the habit of learning about various information life cycles and how they are applied to the real world. These are commonly on any certs that you take so you will see them on the test.

Chapter 22_ Data Sanitation Model

- Here, you'll learn about the various means and methods to apply data sanitation, which is crucial when disposing of data, as well as data storage mediums that are no longer needed. It helps avoid any form of confidential data that could be dumpster dived or even stolen by an attacker via a physical breach to the system, which forensics tools can be applied to to gain any and all information from the storage medium.

Chapter 23_ DNS Record Types

- Here, you'll learn about the various DNS server records that exist, as well as how to move and interact with them via linux commands that can be used to pull and move zone records.

Chapter 24_ IP Error Codes

- Here, you'll learn about the common ICMP error messages and codes that will often come up on your exams. This is a short module but you'll see it on the test like all of the material on here.

Chapter 25_ Intro to NetCat

- Here, you'll learn about the basics on how to banner grab with the netcat tool, as well as how to apply it to pipe over various HTTP headers to various web applications in order to invoke unique responses from the server side.

- A special lab where I'll showcase how to use the tool to apply HTTP methods with the SanDisk Wireless flash drive will also be located here

Chapter 26_ Intro to NMAP

- Here, you'll learn about the core functionals of the nmap tool. You'll get examples on all of the basics that are needed for each option and how to apply them effectively during the scanning and enumeration phase of a penetration test.

Chapter 27_ Intro to SNORT

- Here, you'll learn about the basics of how to use the snort IDS/IPS system so that you can learn core blue teaming fundamentals here.

- I'm also going to show you how to use the tool maliciously so that you can "***live off the land***"

Chapter 28_ Intro To WireShark

- Here, you'll learn about the basics of how to use wireshark, as well as how to use tcpdump it in order to analyze network traffic, which is going to dive a bit more into complex topics like ARP SPOOFING and DNS poisoning to capture network traffic and strip it on a network. Live demonstration video on how to poison networks using the tools will be provided here, as well as how to intercept and steal plain text credentials being sent to a web application server.

Software Engineering

It's no shocker that I'm a big fan of programming and overall have talked about how it plays a vital role in Cyber Security. Whether you are pursuing stuff like: ***Security Engineering***, ***Forensics***, etc, there are many aspects of Cyber where knowing how to code is critical! It's also practical and highly common if you wish to pursue stuff like penetration testing. There are a ton of tools that will help you get the job done automatically, HOWEVER, there are also a lot of items where you need to get your hands a bit dirty and do things manually!

In this section of the program I am going to teach you the quick basics on how to pick up a programming language, so that you can learn how to apply it for offensive security. The goal is to get anyone up and ready on how to program, as well as cover the secret formula on how to learn any programming language and framework quickly, as you'll often need to stay up to date and pick up technologies fairly quickly if you wish to stay ahead in Cyber Security.

This program does not focus on covering any and all complex concepts for high level software engineering. It's meant to get you up to speed with how to program on the fly and write exploits. If you wish to focus on that type of stuff then you'll have to look elsewhere into a software engineering bootcamp that focuses on that. I show you how to code to write exploits and how to do it quickly ONLY!

There will be more languages coming soon after I've remastered the material to have it focus more on offensive security: Java, C#, and Assembly.

Languages Covered:

- C/C++
- Python3
- Bash/Powershell
- HTML/CSS/Javascript
- PHP
- SQL(MySQL, Postgres, MariaDB, and a bit of Microsoft MYSQL)

Python3:

- You get access to my cheat sheet on how to learn Python3 fundamentals.
- You get access to sample projects to get you up to speed programming in Python3 as well as professional projects to showcase on your GitHub,
- You get access to my cheat sheet on all the main frameworks and modules you need to use python for ethical hacking.

Projects

-> General core programming concepts
-> OOP Programming

(For Ethical Hacking)
-> How to build a TCP Client
-> How to build a TCP Server
-> How to build a UDP Client
-> How to build a UDP Server
-> How to build a SSH Client
-> How to build a SSH Server
-> How to build a HTTP Client
-> How to build a HTTP Server
-> How to build a man in the browser exploit
-> How to build a Crypto malware exploit
-> GUI Programming with PYQT5
-> How to build a SQL injection script

C/C++:

- You get access to my cheat sheet on how to learn C/C++ fundamentals.
- You get access to sample projects to get you up to speed programming in C/C++ as well as professional projects to showcase on your GitHub.
- You get access to my cheat sheet on all the main frameworks and modules you need to use C/C++ for ethical hacking via the Win32 API framework.

Projects

-> General core programming concepts
-> OOP Programming

(For Ethical Hacking)
-> Opening a Process
-> Opening a Window Handle
-> Writing a Keylogger
-> Generating a Message
-> DLL/Code injection
-> Brute Force algorithm to crack hashes
-> Shutting monitors on and off

Bash/Linux/Powershell:

- The main goal of this module is to kill two birds with one stone, learn bash and powershell alongside each other so you save time having to backtrack both.

- You get access to my cheat sheet on how to learn Bash/Linux fundamentals as well as a cheat sheet that translates all the stuff that we cover in it for Powershell.

- You get access to sample projects to get you up to speed programming in Bash/Linux as well as professional projects to showcase on your GitHub.

- You get access to my master manual and Master script that helps you learn Kali linux and how to apply what we cover to all of that as well.

- ***This is going to be one of the longest modules as it covers a lot of core fundamentals on how to use the linux kernel and GUI environment. PAY CLOSE ATTENTION TO ALL THE STUFF HERE AS IT'S STUFF YOU NEED TO KNOW IN ORDER TO BE PROFICIENT IN LINUX, WHICH ALSO CARRIES OVER TO KALI LINUX!***

The File System:

- You'll get to learn more about the overall linux file system and how to navigate it, as well as what each directory is for.

Shell Features:

- You'll get a handling on a lot of the core basic commands that will allow you to pivot and control the linux file system.

Basic File Operations:

- You'll learn how to list files and folders that are in directories, as well as how to interact with and list information that is in other areas of the file systems.

Directory Operations:

- You'll get a basic feel for how to manipulate folders: creating, removing, cloning them, etc. I'll even go over stuff like using the mount command in order to mound data from various endpoints such as flash drives for example, as well as how to clone entire hard drives and override security permissions that are set for them.

File Viewing:

- You'll get a basic feel for how to view files using the linux terminal, stuff like: cat, tail, head, grep, etc.

File Creation and Editing:

- You'll learn how to create and modify files on the linux file system.

File Properties:

- You'll learn about how to analyze various file properties for files on the file system. This comes in handy when you need to trace back the origins of a file for forensics purposes. It also comes up in a lot of CTF's that involve cipher text analysis, and you having to work with various data compression folders to uncover hidden contents.

File Locations:

- You'll learn how to locate various files and resources on the linux environment.

File Text Manipulation:

- You'll learn how to manipulate various files and resources on the main system.

File compression and Packaging:

- You'll learn how to compress various files and folders with stuff like: zip, gzip, tar, 7zip, etc, and even techniques that will allow you to make password protected folders that secure your data on the linux file system.

- I'll also cover various obfuscation methods that allow you to use an encoder on top of that to better enhance and secure any and all files and resources on your linux system.

Viewing Processes:

- You'll learn how to view any and all main processes on the linux system, as well as the various methods to do so.

Controlling Processes:

- You'll learn how to control various processes, such as: killing jobs, starting/restarting them, and even how to have shellcode commands watch for changes in overall output from ongoing executing commands on the system.

Scheduling Jobs:

- You'll learn how to schedule jobs on the linux system with stuff like chron jobs which allow you to schedule tasks for various points in time, as well as tasks that start on the main overall boot up of the main linux system.

Logins, logouts, and shutdowns:

- You'll learn more about how to interact with users in the overall environment such as checking end users that are logged in and off the system, as well as how to shutdown the main system using the linux terminal.

Users and their environment:

- You'll learn how to pull information about end users in the overall linux environment, as well as how to check information about files and resources that belong to them on the system.

User Account Management

- You'll learn how to create end user accounts on the main system, how to set permissions for them via sudoers file configurations, as well as how to set up home directories and even do stuff like execute command on behalf of them, and even check root privileges and commands

Becoming Super User

- You'll learn how to become root and control the main system, as well as how to maintain overall root privileges on the main system

Host Information/Location

- You'll learn how to get more in depth information about your current host system, as well as other host systems such as web applications. There will be basic coverage of information on stuff like the host command which can be used to pull zone records

Network Connections

- You'll learn about basic networking protocol commands on the linux system: ftp, ssh, smtp, etc.

Audio and Visual

- I'll show you how to set up basic audio, visual, as well as sound for the linux environment. You'll even get to see how to configure bluetooth services so they work on the linux system

Installing Software

- You'll learn various ways to install and configure programs on the linux system

Programming with Shell Scripting

- You'll learn all the core basics on how to apply bash and powershell for general programming that will allow you to automate scripts to save time on various tasks

HTML/CSS/JavaScript:

- You get access to my cheat sheet on how to learn HTML fundamentals
- You get access to my cheat sheet on how to learn CSS fundamentals
- You get access to my cheat sheet on how to learn Javascript fundamentals and as well as material on how to apply ethical hacking for it
- You get access to my cheat sheet on how to learn Bootstrap5 fundamentals
- You get access to sample projects to get you up to speed programming in HTML/CSS/JavaScript as well as professional projects to showcase on your GitHub

Projects (Vanila HTML)

-> Vanilla CSS will also be covered here as well, along with stuff like grid CSS so you can combine it with Bootstrap CSS to make responsive web applications and focus more on the design aspects.I'll also cover how to mod the site to respond to certain screen resolution sizes as well

-> Setting up HTML document files and overall templates
-> Creating text and editing overall appearance and format
-> Adding tables
-> Adding images
-> Adding URL links and nesting them into images and text on the page
-> Adding videos
-> Using sorted and unsorted lists
-> Working with buttons
-> Adding forms to make various HTTP requests to URL pages
-> Adding input elements: text, password fields, submit boxes, checkboxes, radio selectors, range, uploading files
-> Working with various HTML tags as well as key attributes that are commonly used in them

Projects (Vanilla BootStrap5 HTML)

-> How to setup the main scripts to use the Bootstrap framework
-> Creating Responsive Containers
-> Creating Responsive Rows that contain data elements
-> Creating Responsive Tables
-> Creating Responsive Spinners and Badges
-> Creating Responsive Alert messages
-> Creating Responsive Buttons
-> Creating Responsive Drop Down Menus
-> Creating Responsive Navigation menus
-> Creating Responsive Modal Dialogue prompts and messages
-> Creating Responsive Cards to display profile information
-> Creating Responsive Images
-> Creating Responsive Offcanvas Side Menus
-> Creating Responsive Collapsible content on web application pages
-> Creating Responsive Toast pop up messages
-> Creating Responsive Tooltip pop up messages
-> Creating Responsive Popover pop up messages
-> Creating Responsive forms with hover effects
-> Creating Responsive websites via Grid CSS

Projects Javascript (Vanilla):

-> General core programming logics with JS
-> Grabbing HTML elements by their ID and Class names on the page and modifying them
-> Adding elements to the page by modifying html elements on the page
-> Grabbing Form elements from the URL page as well as input values
-> Grabbing cookie information from the HTML page
-> Opening documents and writing new HTML elements to them on the page
-> Securing URL links with JS

-> Securing Scripts with JS
-> Redirecting end users with JS
-> Opening new URL windows via JS
-> Pivoting through history via JS
-> Setting times events in JS
-> Making HTTP requests via JS

PHP:

- You get access to my cheat sheet on how to learn PHP fundamentals

Projects:

-> General core programming concepts
-> OOP Programming
-> Learning how to interact with MYSQL database backends
-> Learning how to work with various HTTP methods and global variables
-> Cookie session generation so you can keep track of end user sessions and progress on the site
-> Secure coding concepts with PHP for backend server side configurations
-> Learning how to integrate PHP with HTML pages.
-> Learning how to write remote file inclusion exploits with PHP

SQL:

This module is going to cover various database flavors from: ***MariaDB***, ***MYSQL***, ***PostgreSQL***, and a few exploit methods and cheat sheets for stuff like ***MicrosoftMYSQL*** as well, along with how to exploit with them should you manage to find a SQL injection vulnerability whether it be union based or blind based. You'll learn how to also RCE based on the back end you are talking to, as well as learn how to modify databases to elevate your role in a system. Database programming is a core staple and you need to understand some of the basics if you want to exploit SQL injection vulnerabilities.

- You get access to my cheat sheet on how to learn SQL fundamentals
- You get access to sample projects to get you up to speed programming in SQL as well as professional projects to showcase on your GitHub
- You get access to my cheat sheet on all the main frameworks and modules you need to use SQL for ethical hacking via the Win32 API framework

Projects:

-> How to setup a SQL server for various formats
-> General clauses that are used to query data from a database
-> How to sort database information
-> How to filter database information
-> Concatenating database elements
-> Aggregating database queries
-> Using Sub queries
-> Modifying database table entries
-> Executing various stored procedures
-> SQL data types
-> Advanced queries that can be applied to ethical hacking:

Arduino/Electrical Engineering

This is a more laid back module that is going to be super fun and interactive! You'll learn the core basics of arduino and electrical engineering so that you can learn how to make your own physical penetration testing tools like how ***Hack5 does***. The 2 main projects which will be your end goal by the end of the section will be a hands-on lab on how to make a ***Rubber Ducky*** that can write its own code, as well as how to build a drone.

This will be a recorded workshop that you can follow along to get the gist of it. It will also cover the core basics of **Soldering techniques** that you need to know in order to build your very own drone.

You'll even learn how to program your very own remote controller so you can control the drone itself!

Projects:

-> Programming LED pin modules
-> Programming Switch modules
-> Programming Potentiometer modules
-> Programming a remote controller module
-> Programming radio modules to transmit wireless data
-> Programming Servo motor modules
-> Programming RFID NFC card modules
-> Programming LCD screen modules
-> Programming Rubber Ducky modules
-> Programming Your Own Custom drone! (FINAL PROJECT)

Pen-Testing Domains (Hands On Training)

This section is more focused on the hands on part from everything that you have learned from the entire program. I recommend going through a lot of the material so you have the core knowledge and practice to tackle the labs, otherwise you'll struggle with these.

This section is going to feature a lot of live video content that you can follow along and practice on your own.

THIS HANDS ON TRAINING IS GOING TO COVER OVER 50+ UNIQUE TOOLS THAT YOU CAN USE TO AID YOU IN A VARIETY OF SITUATIONS. THIS MIGHT GO INTO THE HUNDREDS DEPENDING ON WHICH ONES I FELL ARE BEST TO SHOW YOU! PRACTICALITY IS EVERYTHING!

Network Penetration Testing:

Botnetting:

- You'll also need to know the projects for the Python3 section to create TCP/UDP/SSH backdoor client and servers for the second half of the lab to complete it!

ARP Poisoning:

- Here, you'll get more hands-on experience with how to use wireshark maliciously for network traffic analysis and waterhole analysis based attacks.

- You'll also get to learn how to DNS poison so that you can trick end users into visiting fraudulent sites and giving away sensitive info, while stripping the encryption that is in place on any and all connections to get plaintext information

- You'll also learn how to view plain text information of insecure data communication protocols such as HTTP and telnet for example.

LAN Turtles

- Here, you'll be tasked with building your own custom LAN turtle that can write its own code. For this lab you'll need access to only one simple hardware module that will allow you to integrate the virtual keyboard module from arduino with it to perform keyboard injection.

MITB

- For this lab, you'll try to setup an exploit that will watch any and all credentials from a dummy browser you'll custom design.

WIFI Hacking

- You'll get hands on experience with how to hack into and crack wireless encryptions to breach access points
- ***This part of the lab will require you to have certain gear in order to complete it***

Evil Twin Attack.

- This part of the lab is an extension of the previous one.
- I recommend that if you plan to start this module, that you cover the wifi hacking one as it's based off of that but a step further

Mobile Hacking

You'll learn how to apply use the metasploit framework to hack into various mobile devices: pull contacts, text messages, and a lot of other meterpreter features that can be utilized, as well as how to use msfvenom to create, obfuscate, and encode payloads

General Labs

Physical Hacks

- During this hands-on training you'll learn how to bypass physical security on a system to steal sensitive data and or leave malicious payloads on the system, bypassing any form of security on it.
- You'll also learn how to steal stuff like configuration files that store end user browser sessions, cookie data, and a lot more, as well as how to steal and or reset end user login passwords for windows systems

Bluebugging Attacks

- During this hands-on training you'll learn how to perform recon for bluetooth IoT devices.
- ***The main part of this lab will require you to have what is known as a smart lock, which we are going to crack using a tool known as "bettercap", a common tool that is multi purpose for bluebugging attacks***

Cipher Text Analysis

- During this lab you'll be tasked with analyzing and reverse engineering cipher text in order to secure the hidden contents that lay behind it. ***This will involve a CTF challenge that you'll have to do on your own***!

Burp Suite

- Learn the core basics of how to use the burp suite tool, and even how to leave proxy servers on systems to spy on end user data. This is one of your bread and butter tools so don't skip it. YOU WILL NEED IT!

BufferOverflow

- This one is going to be extra special when it's ready, as it's one of the most complex ones to cover. This will be updated right around the time I have the assembly module for the programming section done as these two go hand in hand. You can't master this without learning both.

CTF TRAINING (Hands On Training)

As you know, CTF's are a great means for hackers to gain practice exploiting vulnerable systems. It helps you get into the habit of knowing what to look out for when trying to breach a system, or even when you want to dive into stuff like bug bounty hacking for example.

More platforms will be coming soon like ***PortSwigger*** and ***TryHackMe*** Which I will pluck from and choose which are best to cover

HackTheBox

The following machines will be covered in order to get you some more hands on experience for ethical hacking

I'll also show you how to set up the main openvpn configuration for the platform so you can start hacking right away wherever you are. It's a bit complicated if you are new to it!

Machines:

These are all the starting point tier 1-3 to get you used to penetration testing.
The last one is one of the main machines that are from the wild.

- Meow
- Fawn
- Dancing
- Redeemer
- Appointment
- Sequel
- Crocodile
- Responder
- Three
- Architype
- Oopsie
- Vaccine
- Unified
- Cozy Hosting

PicoCTF

- Basic Mod
- Enhance
- Forbidden Paths
- Secrets
- Search Source

Custom CTF challenges

- WordPress CTF challenge
- Futaba's Playground (***This is your graduation challenge!)***

Goodies:

As the brand gets more reputation and I get sponsored I plan to host a variety of major content.

Master manual:

This is a manual that I've customized that you can grep through to pull up the right tool for the right situation. It covers over 100 tools, as well as techniques that you can keep on reference and a lot more on the go, as well as mini scripts you can copy and paste to install them all ease of access

Master Script:

This is going to install and configure your entire system to have any and all tools that you could ever need for any and all penetration tests.
